Experiment No: 06

Experiment name: Switching an interface to move a host around a network using mininet.

Objectives:

Mininet is a network emulator which creates a network of virtual hosts, switches, controllers, and links. From this lab, we can learn:-

- a) How to install mininet and use it
- b) How to prototyping a large network on a single machine by mininet.

Source code:

```
from mininet.net import Mininet
from mininet.node import OVSSwitch
from mininet.topo import LinearTopo
from mininet.log import info, output, warn, setLogLevel
```

```
from random import randint
```

```
class MobilitySwitch( OVSSwitch ):
    "Switch that can reattach and rename interfaces"
```

```
    def delIntf( self, intf ):
        "Remove (and detach) an interface"
        port = self.ports[ intf ]
        del self.ports[ intf ]
        del self.intfs[ port ]
        del self.nameToIntf[ intf.name ]
```

```
    def addIntf( self, intf, rename=False, **kwargs ):
        "Add (and reparent) an interface"
        OVSSwitch.addIntf( self, intf, **kwargs )
        intf.node = self
        if rename:
            self.renameIntf( intf )
```

```
    def attach( self, intf ):
        "Attach an interface and set its port"
        port = self.ports[ intf ]
        if port:
            if self.isOldOVS():
                self.cmd( 'ovs-vsctl add-port', self, intf )
```

```

    else:
        self.cmd( 'ovs-vsctl add-port', self, intf,
            '-- set Interface', intf,
            'ofport_request=%s' % port )
    self.validatePort( intf )

def validatePort( self, intf ):
    "Validate intf's OF port number"
    ofport = int( self.cmd( 'ovs-vsctl get Interface', intf,
        'ofport' ) )
    if ofport != self.ports[ intf ]:
        warn( 'WARNING: ofport for', intf, 'is actually', ofport,
            '\n' )

def renameIntf( self, intf, newname="" ):
    "Rename an interface (to its canonical name)"
    intf.ifconfig( 'down' )
    if not newname:
        newname = '%s-eth%d' % ( self.name, self.ports[ intf ] )
    intf.cmd( 'ip link set', intf, 'name', newname )
    del self.nameToIntf[ intf.name ]
    intf.name = newname
    self.nameToIntf[ intf.name ] = intf
    intf.ifconfig( 'up' )

def moveIntf( self, intf, switch, port=None, rename=True ):
    "Move one of our interfaces to another switch"
    self.detach( intf )
    self.delIntf( intf )
    switch.addIntf( intf, port=port, rename=rename )
    switch.attach( intf )

def printConnections( switches ):
    "Compactly print connected nodes to each switch"
    for sw in switches:
        output( '%s: ' % sw )
        for intf in sw.intfList():
            link = intf.link
            if link:
                intf1, intf2 = link.intf1, link.intf2
                remote = intf1 if intf1.node != sw else intf2
                output( '%s(%s)' % ( remote.node, sw.ports[ intf ] ) )
        output( '\n' )

```

```

def moveHost( host, oldSwitch, newSwitch, newPort=None ):
    "Move a host from old switch to new switch"
    hintf, sintf = host.connectionsTo( oldSwitch )[ 0 ]
    oldSwitch.moveIntf( sintf, newSwitch, port=newPort )
    return hintf, sintf

def mobilityTest():
    "A simple test of mobility"
    info( '* Simple mobility test\n' )
    net = Mininet( topo=LinearTopo( 3 ), switch=MobilitySwitch )
    info( '* Starting network:\n' )
    net.start()
    printConnections( net.switches )
    info( '* Testing network\n' )
    net.pingAll()

Discussion:

Mininet is a software emulator for prototyping a large network on a single machine. Mininet can be used to quickly create a realistic virtual network running actual kernel, switch and software application code on a personal computer. Mininet allows the user to quickly create, interact with, customize and share a software-defined network (SDN) prototype to simulate a network topology that uses Openflow switches.

From the lab, We check simple mobility test by mininet. h1, h2, h3 are hosts and s1, s2, s3 are switches. We move a host from s1 to s2, s2 to s3, and then back to s1. Thus we check simple mobility test among the hosts.
